Canva Infographic Size Card

geniusjunkie.net

The ceiling, the export arithmetic, and the three shapes. Verified 6 October 2026.

THE CEILING

Canva's maximum design size is 8000 x 3125 px - PER AXIS.

Minimum 40 x 40. Canva Help Centre: if the custom size fields turn red "it means the values are less than or exceed the size limits". So your width can be 8,000. Your HEIGHT stops at 3,125, and an infographic is the one format that is inherently tall - it is the only design type where this bites.

There is no warning text, no suggestion, no offer to scale it. The field simply refuses the number.

THE FIX - DESIGN SMALL, EXPORT BIG

A Canva design downloads as a PNG at between 0.5x and 3.125x its size. That multiplier is the escape hatch: the ceiling is on the CANVAS, never on the export. So work backwards from the pixels you actually want.

design size	x	multiplier	=	output
450 x 3000		2x		900 x 6000
600 x 2400		2.5x		1500 x 6000
640 x 3125		3.125x		2000 x 9765

THE CONSEQUENCE NOBODY CHECKS: every photo you place needs at least the multiplier times the resolution it looks like it needs. Sharp at 450 wide is SOFT at 900.

THE THREE SHAPES - FROM CANVA'S OWN INFOGRAPHIC PAGE

Canva recommends a tall column for a blog and two landscapes for social. They are not variations of each other - there is no single artwork that is both. The tall one is your MASTER; the landscape ones are EXTRACTS: one section, one number, one claim, re-laid out to fill a wide frame.

BLOG 663 x 2000 | FACEBOOK 1200 x 628 | LINKEDIN 1104 x 736

Resize changes the canvas.
It does not re-think the layout.

A tall column squashed into a landscape box is unreadable every time. Three extracts from a ten-section infographic is plenty - and only the sections that work ALONE.

THE TEN-SECOND TEST ALMOST NOBODY DOES

Zoom out until the whole thing fits on screen at about the size of a postage stamp - roughly what a feed, a preview thumbnail or a search result shows.

SHOULD SURVIVE: the shape of it, the colour blocks, and the biggest numbers.
ALL GREY TEXTURE: the type is too uniform. Make THE NUMBERS bigger - not the headings.
Then check the top two inches on their own - often the only part that gets seen at all.

SEVEN CHECKS BEFORE YOU EXPORT

* The design fits inside 8,000 x 3,125
* You know the multiplier that gets you the pixels you want
* **Every photo is at least that multiplier x the resolution it looks like it needs**
* It still reads at thumbnail size, and the numbers are what survive
* The title and your best number are both in the top two inches
* The sources are ON the image, with a date
* The landscape extracts are re-laid out, not squashed

The third is the one nobody checks until the export comes back soft - and by then the design is finished.

And put the source on the image itself, with a date. A caption does not travel with a screenshot.
