Canva Wedding Website Checklist

geniusjunkie.net

Publishing rules, the RSVP trap, and the phone checks. Verified 19 October 2026.

THE TRAP - THE RSVP FORM BELONGS TO WHOEVER MADE IT

Every reply lands in the form owner's Responses tab - not the couple's.

Google: "form owners can download and delete existing responses." Build the site for someone else, or sell it as a template, with YOUR form behind the RSVP button and every guest list ends up in your account. Sharing the form does not fix it - that gives them access to yours. They need their own COPY.

Your own wedding	**nothing to do - you own the form**
Built for someone	**they make the form, or More > Make a copy (Google help)**
Selling the template	**form URL ending in /copy - prompts each buyer to copy it ***

** From a Google Docs Editors COMMUNITY guide, not an official policy page - test it before you rely on it.*

Then let Google close it: Accepting responses > Set close date. Late RSVPs after the caterer has the numbers are worse than none.

CANVA'S PUBLISHING RULES - THE TEMPLATE DECIDES THE ADDRESS

Free .canva.site address: the design must come from a WEBSITE template.
Mobile website / Link in Bio templates: canva.link only, and NO custom domain.
Canva: "Canva Free users can have up to five live websites on the free domain."
The Designed with Canva footer stays on Free - removing it needs Pro.
Publish website > Site address > Settings > Continue > Publish.

The address is a promise: once it is printed on an invitation it cannot change. Name it, then print it.

THE PHONE - MOST GUESTS NEVER SEE THE DESKTOP VERSION

Turn on "Resize on mobile" in the publishing settings - then do not trust it.
Preview in mobile view and go through EVERY page, top to bottom.
Look for: text that moved, text shrunk to nothing, buttons too small for a thumb.
Anything side by side on desktop has to stack on a phone - the stacking is where it breaks.
The countdown is made with Canva Code (Canva's own wedding page) - check the time zone.

GETTING IT TO THE GUESTS

Test the link from a phone that is NOT yours - logged in, you may not see what a guest sees.
QR code on the printed invitation: large, plain background, scanned from the PRINTED PROOF.
A QR code that works on a laptop and fails on paper is the most common way this goes wrong.

SEVEN CHECKS BEFORE YOU SEND THE ADDRESS TO ANYONE

* The design was made from a Website template
* **The RSVP button points at a form the COUPLE owns - not you**
* You filled in the RSVP yourself on the published site, and it arrived in the right account
* Resize on mobile is on, and every page was checked in mobile view
* The RSVP button is big enough to tap with a thumb
* The form has a close date
* The QR code scans from the printed proof, not just the screen

The second is the one that goes wrong silently - and nobody finds out until the guest list is missing.
